

# Project Title: Recipe Book Using HTML

## Project Description:

In this mini project, you will create a simple recipe book webpage using only HTML semantic tags. The goal is to organize and display a collection of recipes in a structured manner without any CSS styling.

## Requirements:

**HTML Semantic Tags:** You should use HTML5 semantic tags to structure the recipe book. Use tags such as `<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, `<aside>`, and `<footer>` appropriately.

**Recipe Content:** The webpage should feature a collection of at least three recipes. Each recipe should include:

- A title.
- An introduction/description of the recipe.
- A list of ingredients.
- A list of instructions for preparation.

**Navigation:** Include a navigation menu or a table of contents at the beginning of the page that links to each recipe on the same page. Each link should use anchor tags (`<a>`) to navigate to the corresponding recipe section.

**Images:** You should include an image for each recipe using the `<img>` tag. The images should be relevant to the recipe.

**Documentation:** You must provide comments in HTML code to explain how you have structured the recipe book and organized the content.
